DATAMINDS · PALANTIR FOUNDRY SERVICES

Certified Foundry engineers, on your enrollment.

Five years of delivery on Palantir Foundry and AIP: pipelines, Ontology, applications and AI use cases, built to Palantir's own patterns and handed over to your team.

What we do on Foundry

- Workflow implementation: Pipeline Builder and code repositories, Ontology design, Workshop applications, AIP Logic.
- Migration of existing pipelines and models into Foundry, or out of it.
- AIP use cases on your Ontology: assistants, document extraction and agents, with evaluation.
- Health checks of an existing enrollment: cost, performance, permissions, pipeline hygiene.
- Support and enablement for your users, from data engineers to operators.

How we work with you

- Fixed-scope projects: one workflow, one metric, a fixed price, production in 90 days or less.
- Forward-deployed engineers: a certified Foundry engineer inside your team on a monthly rate.
- Support retainers: reviews, office hours and on-call for the hard cases.
- Your enrollment, your data, your accounts. We work as named users you control.

Who is on the work

A small senior team in Thessaloniki, Greece. The engineers who scope the work are the engineers who build it. Foundry certified, with five years on the platform across data engineering, application development and AIP.

Sample document. This placeholder will be replaced by the prepared services overview.

GETTING STARTED

Three ways to begin.

1. A 30-minute call

Tell us where Foundry stands in your organisation: an enrollment with a backlog, a rollout that stalled, or an evaluation before you commit. We tell you what the first workflow worth shipping would be and what it would take.

2. A scoped first workflow

A written blueprint with a success metric in your units, a timeline and a fixed price. If the honest answer is that Foundry is not the right tool for the problem, we say that instead.

3. A prototype on a developer-tier account

Palantir's free AIP developer tier gives a Foundry and AIP environment with metered compute and storage. We can build a prototype there on a sample of your data before you buy an enrollment, so the decision is made on a working system rather than a demo.

What an AIP account is

AIP is Palantir's Artificial Intelligence Platform, the layer of Foundry that connects language models and agents to your Ontology and your data with the platform's permissions and audit intact. Production use runs on an enterprise enrollment; the developer tier exists for learning, evaluation and prototyping.
